Abstract

The Moroccan Maternal Health Landscape Revisited Through Community Health Worker Programmes: An Eswatini Lens explores the impact of community health worker programmes on maternal health outcomes in Moroccan cities, providing a unique perspective from an Eswatini viewpoint. The study synthesises existing data on community health worker initiatives, including qualitative interviews with healthcare providers and quantitative analyses of health records. It employs thematic analysis to interpret the collected information. A notable finding is that community health workers significantly reduced maternal mortality rates by 25% in urban Moroccan areas over a two-year period, particularly among low-income communities. The review underscores the critical role of community health workers in enhancing access to healthcare services and improving maternal health outcomes. Recommendations include expanding these programmes to rural regions and integrating them with national health strategies. Develop comprehensive training programmes for community health workers, integrate their activities into national health policies, and evaluate long-term sustainability through regular research updates.
