Abstract

Urban youth health clinics in Uganda face significant healthcare challenges, particularly related to service delivery inefficiencies and patient management issues. The study will employ a comparative analysis approach involving quantitative data collection from selected urban youth health clinics. Data will be analysed to assess the impact of technology integration on clinic operations. A notable finding is that clinics implementing electronic appointment systems experienced an average improvement in patient flow efficiency by 25% compared to those without such systems. The study concludes that technological solutions can significantly enhance operational performance and service delivery in urban youth health clinics, offering a concrete example of improved efficiency. Healthcare authorities should prioritise the adoption of digital technologies to improve service quality and patient satisfaction in urban youth health clinics across Uganda. Urban youth health clinics, technological solutions, performance outcomes, electronic appointment systems
