## ABSTRACT

**Background:** Power distribution losses in developing economies are a critical engineering challenge, with technical and non-technical inefficiencies causing substantial economic and operational strain. Existing evaluation methods for network interventions often lack rigorous field-based causal evidence, particularly in sub-Saharan African contexts.

**Purpose and objectives:** This article presents a novel methodological framework for conducting a randomised field trial (RFT) to causally evaluate the efficiency gains from deploying advanced distribution equipment, specifically composite conductor technology and smart meters, within a national utility.

**Keywords:** *Randomised controlled trial, Distribution network losses, Sub-Saharan Africa, Technical losses, Non-technical losses, Power sector reform, Field experiment*

### Article Highlights

- Proposes a novel randomised field trial (RFT) framework for evaluating power distribution efficiency gains.
- Clusters medium-voltage feeders into matched pairs for random assignment to treatment or control groups.
- Employs a differences-in-differences model to estimate the causal Average Treatment Effect (ATE).
- Explicitly addresses implementation challenges like geographic stratification and field crew blinding.

### Core Statistical Model

The primary analysis uses a differences-in-differences specification to estimate the Average Treatment Effect on technical loss percentage, with inference based on cluster-robust standard errors at the feeder level.

*This is a methodology paper presenting a trial design framework, not empirical results from its application.*

## **ABSTRACT-ONLY PUBLICATION**

This is an abstract-only publication. The complete research paper with full methodology, results, discussion, and references is available upon request.
