Author notes

Caleb Ezeanolobi is affiliated with Department of Electrical Engineering, University of Lagos and focuses on Engineering research in Africa.

Felix Ogunlana is affiliated with Department of Civil Engineering, National Centre for Technology Management (NACETEM) and focuses on Engineering research in Africa.

Chinedu Obiakoh is affiliated with National Centre for Technology Management (NACETEM) and focuses on Engineering research in Africa.

Osita Nwosu is affiliated with Department of Sustainable Systems, University of Jos and focuses on Engineering research in Africa.

Abstract

This study addresses a current research gap in Engineering concerning Methodological evaluation of municipal infrastructure assets systems in Nigeria: randomized field trial for measuring risk reduction in Nigeria. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A mixed-methods design was used, combining survey and interview data collected over the study period. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. Methodological evaluation of municipal infrastructure assets systems in Nigeria: randomized field trial for measuring risk reduction, Nigeria, Africa, Engineering, original research This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. The maintenance outcome was modelled as $Y = \beta_0 + \beta_1 X + u + \epsilon$, with robustness checked using heteroskedasticity-consistent errors.
