Author notes

Khumalo Cele is affiliated with Agricultural Research Council (ARC) and focuses on Engineering research in Africa.

Sipho Mkhontoše is affiliated with Department of Mechanical Engineering, Cape Peninsula University of Technology (CPUT) and focuses on Engineering research in Africa.

Makgoba Nxaba is affiliated with Council for Scientific and Industrial Research (CSIR) and focuses on Engineering research in Africa.

Gqoza Pule is affiliated with Department of Mechanical Engineering, Cape Peninsula University of Technology (CPUT) and focuses on Engineering research in Africa.

Abstract

This study addresses a current research gap in Engineering concerning Methodological evaluation of municipal infrastructure assets systems in South Africa: multilevel regression analysis for measuring efficiency gains in South Africa. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A structured analytical approach was used, integrating formal modelling with domain evidence. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. Methodological evaluation of municipal infrastructure assets systems in South Africa: multilevel regression analysis for measuring efficiency gains, South Africa, Africa, Engineering, case study This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. The maintenance outcome was modelled as $Y_i = \beta_0 + \beta_1 X_i + u_i + \varepsilon_i$, with robustness checked using heteroskedasticity-consistent errors.
