ABSTRACT

Background: Evaluating the long-term cost-effectiveness of water treatment infrastructure in low-resource settings remains a significant methodological challenge, particularly for isolating the causal impact of specific interventions from confounding factors.

Purpose and objectives: This working paper presents a novel quasi-experimental design to diagnose the cost-effectiveness of water treatment systems. The primary objective is to provide a robust methodological framework for engineers and policymakers to assess the financial and operational efficiency of such infrastructure.

Keywords: *Quasi-experimental design, Cost-effectiveness analysis, Water treatment systems, Sub-Saharan Africa, Infrastructure evaluation, Development engineering*

Article Highlights

- Proposes a novel difference-in-differences framework for infrastructure evaluation.
- Addresses the challenge of isolating causal impact from confounding factors.
- Designed for application in low-resource, real-world engineering contexts.
- Aims to provide actionable diagnostics for policymakers and engineers.

Core Statistical Model

The analysis employs a district-level DiD model: $Y_t = \beta_0 + \beta_1 \text{Treat}_t + \beta_2 \text{Post}_t + \beta_3 (\text{Treat} \times \text{Post})_t + \gamma X_t + \varepsilon_t$, where Y is the cost-effectiveness ratio.

This is a methodological paper; full empirical results from the 2000–2026 study are forthcoming.

ABSTRACT-ONLY PUBLICATION

This is an abstract-only publication. The complete research paper with full methodology, results, discussion, and references is available upon request.
