Author notes

Nkechi Anyanwumah is affiliated with Department of Electrical Engineering, University of Lagos and focuses on Engineering research in Africa.

Uche Nnamdi is affiliated with University of Port Harcourt and focuses on Engineering research in Africa.

Chizzy Obinna is affiliated with Department of Civil Engineering, University of Port Harcourt and focuses on Engineering research in Africa.

Abstract

This study addresses a current research gap in Engineering concerning Methodological evaluation of power-distribution equipment systems in Nigeria: panel-data estimation for measuring adoption rates in Nigeria. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A mixed-methods design was used, combining survey and interview data collected over the study period. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. Methodological evaluation of power-distribution equipment systems in Nigeria: panel-data estimation for measuring adoption rates, Nigeria, Africa, Engineering, original research This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. The maintenance outcome was modelled as $Y_i = \beta_0 + \beta_1 X_i + u_i + \epsilon_i$, with robustness checked using heteroskedasticity-consistent errors.
