Abstract

Healthcare access in South African slums is often limited by geographical barriers and socio-economic challenges. A mixed-methods approach combining quantitative data from health records with qualitative interviews to assess programme effectiveness and community engagement. Community-based healthcare outreach can significantly impact mortality rates, especially when tailored to address specific local needs and challenges. Further research should explore scalability and sustainability of these interventions in other urban settings with similar demographics.

Keywords: *African Geography, Slums, Community Health Centers, Mortality Rates, Public Health Interventions, Qualitative Research, Quantitative Data Analysis*

ABSTRACT-ONLY PUBLICATION

This is an abstract-only publication. The complete research paper with full methodology, results, discussion, and references is available upon request.
