Author notes

Moses Kilishi is affiliated with Sokoine University of Agriculture (SUA), Morogoro and focuses on Energy research in Africa.

Tinashe Mawejje is affiliated with University of Dar es Salaam and focuses on Energy research in Africa.

Agnes Simba is affiliated with Department of Interdisciplinary Studies, State University of Zanzibar (SUZA) and focuses on Energy research in Africa.

Kamila Mwaluko is affiliated with Department of Research, Sokoine University of Agriculture (SUA), Morogoro and focuses on Energy research in Africa.

Abstract

This study addresses a current research gap in Energy concerning Methodological evaluation of field research stations systems in Tanzania: quasi-experimental design for measuring clinical outcomes in Tanzania. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A mixed-methods design was used, combining survey and interview data collected over the study period. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. Methodological evaluation of field research stations systems in Tanzania: quasi-experimental design for measuring clinical outcomes, Tanzania, Africa, Energy, mixed methods study This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. The empirical specification follows $Y = \beta_{0+\beta}^{-1} p X + \text{varepsilon}$, and inference is reported with uncertainty-aware statistical criteria.

Keywords: Tanzania, Mixed Methods, Quasi-Experimental, Quantitative Analysis, Qualitative Research, Health Systems, Evaluation Techniques
