## Abstract

Mobile health clinics have been introduced in remote villages of Burkina Faso to address healthcare challenges faced by underserved populations. A survey was conducted in across various remote villages, employing a structured questionnaire to gather data on patient experiences and perceptions of the mobile clinics. The survey revealed that approximately 75% of respondents reported feeling satisfied with the services provided by the mobile health clinics, highlighting their effectiveness in addressing healthcare needs in remote areas. Mobile health clinics appear to be a viable solution for improving access to healthcare in rural settings of Burkina Faso. Patient satisfaction was significantly influenced by clinic proximity and perceived quality of care offered. Future initiatives should focus on enhancing the visibility and accessibility of mobile clinics, particularly through targeted awareness campaigns and partnerships with local leaders.
