Author notes

Thembekile Cele is affiliated with Department of Surgery, African Institute for Mathematical Sciences (AIMS) South Africa and focuses on Medicine research in Africa.

Nomonde Nkabinde is affiliated with African Institute for Mathematical Sciences (AIMS) South Africa and focuses on Medicine research in Africa.

Siphamandla Mkhize is affiliated with Graduate School of Business, UCT and focuses on Medicine research in Africa.

Mamphela Khumalo is affiliated with Graduate School of Business, UCT and focuses on Medicine research in Africa.

Abstract

This study addresses a current research gap in Medicine concerning Methodological evaluation of community health centres systems in South Africa: panel-data estimation for measuring yield improvement in South Africa. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A structured analytical approach was used, integrating formal modelling with domain evidence. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. Methodological evaluation of community health centres systems in South Africa: panel-data estimation for measuring yield improvement, South Africa, Africa, Medicine, case study This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. Treatment effect was estimated with $\text{text}\{\text{logit}\}(\pi) = \beta_0 + \beta^T p X_i$, and uncertainty reported using confidence-interval based inference.
