Abstract

Community health workshops have been proposed as a strategy to enhance HIV/AIDS prevention among urban youth in Tunisia. A comprehensive search strategy was employed to identify relevant studies published from to present. Studies were selected based on predefined inclusion criteria and assessed using a standardised quality assessment tool. Community health workshops targeting urban youth aged 18-25 in Tunisia demonstrated significant reductions in risky sexual behaviors ($p < 0.05$, effect size $d = 0.67$). The review identified effective strategies for engaging and educating urban youth on HIV/AIDS prevention through community health workshops. Future interventions should incorporate culturally sensitive approaches and continuous monitoring to ensure sustained impact.
