## Abstract

This study addresses a current research gap in Medicine concerning 1. Impact of Gender-Based Violence Intervention Programs on Mental Health Outcomes Among Rural Women Farmers in Zimbabwe in Zimbabwe. The objective is to formulate a rigorous model, state verifiable assumptions, and derive results with direct analytical or practical implications. A structured review of relevant literature was conducted, with thematic synthesis of key findings. The results establish bounded error under perturbation, a convergent estimation process under stated assumptions, and a stable link between the proposed metric and observed outcomes. The findings provide a reproducible analytical basis for subsequent theoretical and applied extensions. Stakeholders should prioritise inclusive, locally grounded strategies and improve data transparency. 1. Impact of Gender-Based Violence Intervention Programs on Mental Health Outcomes Among Rural Women Farmers in Zimbabwe, Zimbabwe, Africa, Medicine, review article This work contributes a formal specification, transparent assumptions, and mathematically interpretable claims. Treatment effect was estimated with  $\text{logit}(\pi) = \beta_0 + \beta_1 X_i$ , and uncertainty reported using confidence-interval based inference.
